Application No.: 10/601,898 Reply to Office Action dated: November 20, 2006 Reply dated: April 9, 2007

In the Specification:

Please amend the Specification as shown below. Applicant respectfully submits that the proposed amendments correct informalities in the Specification and that no new matter is being added.

Please add new paragraph [0013.1] as shown below:

[0013.1] The terms JAVA, JAVA 2 Enterprise Edition (J2EE), JAVA Message Service (JMS), Enterprise JAVA Bean (EJB), and JAVA Management Extensions (JMX), are trademarks of Sun Microsystems, Inc. The terms WebLogic, and WebLogic Server, are trademarks of BEA Systems, Inc.

Please replace paragraph [0002] with that shown below:

Please replace paragraph [0013] with that shown below:

[0013] In accordance with one embodiment the invention comprises a system having an extensible engine that performs the task of parsing input data and converting it to [[Java]] an

Application No.: 10/601,898 Reply to Office Action dated: November 20, 2006

Reply dated: April 9, 2007

interface specification, such as JAVA_JMS/JMX API, and then executes the JMSML program. In

other embodiments the invention includes methods of using JMSML to access JMS/JMX APIs.

Please replace paragraph [0033] with that shown below:

[0033] An embodiment of the invention provides a markup language (referred to herein as JMSML), and user interfaces, that are useful for creating simple and reusable JMS components.

The JMS components can be used for performing JMX operations necessary for dynamic

configuration, management and runtime monitoring of a JMS server, in addition to performing enterorise messaging using the JMS operations. JMSML is a mark-up language designed and

developed to make [[Java]] interface specification, such as JAVA Message Service (JMS) and

[[Java]] JAVA Management Extensions (JMX) programming easy by hiding the JMS and JMX

[[Java]] JAVA API complexity behind a few easy-to-use XML tags. Embodiments of the invention

include systems and methods that utilize JMSML to abstract the complexity of the JMS and JMX

APIs into a relatively small plurality of tags.

Please replace paragraph [0034] with that shown below:

[0034] In accordance with one embodiment the invention comprises a system having an

extensible engine that performs the task of parsing input data and converting it to [[Java]] an interface specification, such as JAVA JMS/JMX API, and then executes the JMSML program. In

other embodiments the invention includes methods of using JMSML to access JMS/JMX APIs.

Please replace paragraph [0035] with that shown below:

[0035] A typical JMS application development process involves configuring and managing

the JMS server components, such as the JMSConnectionFactory, JMSDestination, etc., on the

JMS Provider application server, and then writing JMS application clients that will make use of these administered server-side objects to perform [Java]] JAVA messaging. JMS application

clients are written in Java using the JMS API, and are categorized into two types of programs:

Stream, Bytes) and send them to the JMS destinations (Queues and Topics). Consumers receive the messages from the JMS destinations (Queues and Topics), both synchronously and

asynchronously. The JMS API enables both producers and consumers to utilize various qualities

of service (QOS) that are provided by the underlying JMS implementation and by the JMS providers

(such as transaction, acknowledgment, etc.).

Please replace paragraph [0039] with that shown below:

[0039] In accordance with one embodiment, JMSML is implemented as a number of neatly

abstracted [[Java]] <u>JAVA</u> components grouped together as the extensible JMSML engine., which utilizes technologies like JMS, JMX and XML to deliver the power that a JMS application developer

needs, while hiding all the finer details of [[Java]] JAVA and JMS API behind a few XML tags.

Please replace paragraph [0108] with that shown below:

[0108] The JMSML language can be supported in a variety of different environments and

through a variety of different interfaces, which can be presently summarized as follows:

1. JMSML Integrated Development Environment (IDE);

Standalone Java Client; or,

[[Java]] <u>JAVA</u> Servlet webapp.

Please replace paragraph [0132] with that shown below:

[0132] Figure 16 shows a flowchart of the operation of a JMSML system that includes a

command-line interface in accordance with an embodiment of the invention. In step 530, the user opens a command-line interface at the client. The user then, in step 532, enters commands to

invoke a [[Java]] JAVA method. In step 534, the corresponding command (in XML format) is

passed to the JMS engine. In step 536, the JMSML engine generates the appropriate interface

specification commands, such as JMS/JMX commands and communicates them to the relevant

server. Results may be optionally generated, and in step 538 stored in an optional results file.

Please replace paragraph [0150] with that shown below:

[0150] The next time the same command line is executed, JMSML then treats the

"imstest.xml" as a test case and prints out the test pass/fail result to the stdout. As can be seen,

without writing a [[Java]] JAVA program, we have quickly written a complete test case for BEA

WebLogic JMS and JMX features.
